

Alexander Frantsev

Senior Data Scientist

as.frantsev@gmail.com | [linkedin.com/in/asfrantsev](https://www.linkedin.com/in/asfrantsev) | t.me/as_frantsev | github.com/WhoKnowsWhoCares

Preferred: remote or hybrid (Moscow)

Summary

Senior Data Scientist with 5+ years in Data Science & Analytics and 5 years in software engineering.

I own ML products end-to-end - from architecture and modeling to production, monitoring and business impact.

Fintech, big tech, retail background: Yandex, SAS Institute; clients include Sber, X5, McDonald's.

Strong academic foundation in mathematics and economics.

Work Experience

Analyst-Developer (Data Scientist), Yandex - FinTech, Payment Analytics

2024 - 2026 Moscow

Owned the payment incident prediction system (anomaly alerting) for Yandex Bank (100k+ DAU) end-to-end: architecture, ML, data pipelines, production, monitoring. The system prevents faulty transaction traffic estimated at ~700M RUB per year.

- Re-architected the anomaly predictor (Python 3, Arcadia, Nirvana orchestration, YTsaurus storage): from a fragile single-maintainer setup to a testable, versioned product with CI and monitoring
- Reduced scoring-to-alert time from ~30 to ~15 min; increased recall on conversion incidents to ~90% via a backtesting framework on historical incidents (precision/recall tracking, dev/prod alert separation)
- Introduced ML and LLMs into production: LLM-based validation of error-code mappings with human-in-the-loop review; ML models for alert accuracy
- Built a Sankey dashboard for cascading payments with drill-down to 10-minute intervals - managers resolve payment cases without analysts; delivered a payment-funnel MVP on trace data, uncovering an anti-fraud anomaly (only 10% of flagged payments succeeded)
- Led conversion research for internal and partner products (taxi, Sber rbs-to-direct migration); findings triggered partner-side engineering fixes
- Built internal tooling: workflow-graph generator, effect-measurement pipeline adopted by anti-fraud

Independent Projects & Trading

2022 - 2024

- ML startup: sports outcome prediction - feature pipeline + LightGBM tuned with Optuna (Python, PyTorch); first production model delivered +3% margin
- Personalized news service: Telegram/RSS/web aggregation with LLM summarization and relevance ranking
- Smart home automation platform on Raspberry Pi / Home Assistant
- Independent securities trading

Data Scientist, SAS Institute - CI & Retail Department

2017 - 2022

ML implementation, analytical data marts, A/B testing and business consulting for big tech companies (Sber, X5, McDonald's, Mondelez).

- Banking, Internal Fraud: fraud detection rules aligned with the bank's business processes
- Retail, Promo Optimization: sales analysis, product segmentation, elasticity estimation, promo optimization on purpose-built data marts
- Retail, Demand Forecasting: time-series models (ARIMA, ETS) and ML ensembles (RandomForest, GradientBoosting) at scale
- Banking, Customer Intelligence: customer segmentation, NLP categorization of payment descriptions, propensity-to-buy models, A/B-tested campaign launches

Software Engineer, UbiqMobile / SPSU R&D startup

2010 - 2015

- Core backend services in .NET for a mobile services platform; Java client on a custom protocol optimized for low-bandwidth connections
- R&D project awarded a Microsoft Seed Fund grant; grew into UbiqMobile, an innovation platform for mobile services

Education

- European University at St. Petersburg - MA in Economics (2015-2017)
- St. Petersburg State University - Specialist degree in Mathematics & Computer Science (2008-2014)
- 2013 CRDF grant for product extension; 2015 Full Fee Waiver Scholarship, European University at St. Petersburg

Skills

- ML / DS: Python (PyTorch, scikit-learn, pandas, LightGBM, Optuna), forecasting, NLP, LLM integration, A/B testing
- SAS stack: SAS EG, EM, FS, Viya, VDMML
- Data & Engineering: SQL (PostgreSQL, ClickHouse, YQL), YTsaurus, workflow orchestration, FastAPI, Docker, Git, Linux
- Languages: English - advanced, Russian - native
